

Measuring Chassis on Jig

1. Remove all front and rear suspension members.
2. Place chassis on the jig so that the measuring pins are opposite the suspension tubes.
3. Insert the measuring pins in the suspension point which appears to be the least damaged.
4. Adjust the frame so that the connected points indicate zero on the calibrated marks.
5. Move the base of the measuring pins which do not fit until a fit or approximate fit is obtained.
